Deep Scan + Valuation

Skyes Over London LC — SOLEnterprises Ecosystem Hub

https://skyesol.netlify.app/

Fair Market Asset Value: $168,400

Indicative range: $152,000 – $189,000 • As of February 25, 2026

Prepared for internal use • Operator-grade assessment based on publicly accessible pages

Executive Summary

This report scans the public-facing surfaces of https://skyesol.netlify.app/ (Skyes Over London LC / SOLEnterprises hub) and produces an indicative asset valuation for the site as an operator-grade, monetization-ready ecosystem portal.

Valuation conclusion: $168,400 (indicative range $152,000 – $189,000), as of February 25, 2026.

Metric	Observed
Total indexed URLs (visual site map)	94 URLs
Blog posts	84 posts across 8 series
Core pages	10 core pages (home, founder, platforms, network, credibility, blog, status, contact, privacy, terms)
Productized services	CineFrame, DataPilot, AccessAtlas, CheckoutForge, SignalFlow, TrustLayer + more
Suite surfaces	SkyeDocx, SkyeFlow, SkyeArchive, SkyeSlides, SkyeOps (PWA-style entry points)

Conclusion: Fair market asset value is $168,400 (range $152,000 – $189,000).

Scorecard

Scores reflect the observed public surfaces only (no private vault/admin functionality included).

Dimension	Score (0–10)	What was observed (public surfaces)
Design + Motion (SVS)	9.2	Cinematic hero framing, cohesive dark theme, consistent nav and section rhythm; strong brand presence.
Information Architecture	8.8	Clear top-level nav plus service taxonomy and SkyeSuite app entry points; a visual site map lists core pages and content inventory.
Content Depth	9.0	Blog archive mapped to 84 posts across 8 series; operator-style longform topics across AI, Phoenix playbooks, and platform notes.
Trust Surfaces	8.6	Dedicated status board, privacy, terms, credibility archive; product pages emphasize governance, auditability, and hardening.
Conversion + Productization	9.1	Service products with explicit deliverables, pricing, deposit schedules, and timelines (CineFrame/DataPilot/etc.).
Technical Hygiene (SEO/Indexing)	7.6	Machine-readable sitemap endpoint returns an error when fetched; blog hub UI is present, but crawl tooling relies on sitemap health.
Ecosystem Leverage	9.0	Network directory links to multiple portals and apps; consistent cross-site linking strengthens authority and internal traffic routing.
Maintainability	8.1	Standardized sections and repeatable product pages suggest templating discipline; some dynamic counters appear as zeros on the home page.

Deep Scan Findings

This site behaves less like a single brochure page and more like a controlled ecosystem hub: portfolio narrative + product catalog + content engine + portal directory + app entry points, all under one standard.

1) Information architecture and crawl surfaces

- Top-level navigation includes Services, Founder, Platforms, Network, Credibility, Blog, Status, and Contact.
- A visual site map surfaces total URL inventory and makes the content graph legible to humans (94 URLs) and supports internal discoverability.
- Machine-readable sitemap.xml appears linked, but fetch attempts returned an HTTP 400 response (indexing risk).

2) Productized service catalog with transparent pricing

Services are written as products (deliverables, timelines, deposits, installments). This is rare, and it raises conversion value and perceived legitimacy.

On-site product (examples)	Published fixed price	Deposit (30%)
CineFrame™ (cinematic web productization)	$78,000	$23,400
DataPilot™ (AI/data apps)	$58,000	$17,400
AccessAtlas™ (portals & hubs)	$48,000	$14,400
CheckoutForge™ (ecommerce & payments)	$42,000	$12,600
TrustLayer™ (trust surfaces)	$54,000	$16,200
SignalFlow™ (intake & routing)	$68,000	$20,400

Deep Scan Findings (continued)

3) Content depth and authority building

A blog hub and site map show a sustained editorial engine: 84 posts across 8 series, spanning operator playbooks (Phoenix), engineering patterns (Devs & AI), and platform-specific notes (SkAIxu IDE). This is a material asset: content compounds over time (search impressions, internal linking strength, trust signals).

4) Suite entry points and offline-first positioning

Multiple SkyeSuite modules present as PWA-style tools with boot sequences, offline-first language, local vaulting, and export-ready workflows (e.g., Skye DocX: “runs offline after first load” + “documents stored in your browser vault”). Even if these are “front doors” rather than full apps, they materially increase perceived capability and platform depth.

Net effect: even if the suite modules are “front doors,” they function as proof surfaces that make the ecosystem feel larger, more engineered, and more monetizable.

Technical Observations and Risks

This section captures only what was observable from public pages and simple fetches (no authenticated crawling, no Lighthouse run, no JS execution tracing).

Indexing and sitemap health

The visual site map links to a machine-readable sitemap.xml, but a fetch attempt returned a 400 response. Fixing this is a high-leverage improvement for a content-heavy site.

Trust surfaces and operational signaling

Dedicated “Status Board” and “Credibility Archive” pages strengthen perceived legitimacy. The network directory claims monitored uptime and encryption, and provides a portal directory that routes traffic across the ecosystem.

High ROI improvements

- Fix sitemap.xml HTTP response and verify robots/canonical consistency for all blog posts.
- Replace zeroed hero counters with real metrics or hide them until data is wired (zeros read as “unfinished”).
- Add Organization + WebSite JSON-LD and per-article schema for blog posts (rich results + clarity).
- Formalize a Trust Center that links Status, Policies, Security Statement, and Contact Governance in one place (you already have the parts).
- Conversion tracking: add a minimal analytics and event taxonomy to quantify CTA performance across services.

Valuation Methodology and Model

This is an asset valuation of the web property (design system, information architecture, content library, productization surfaces, trust surfaces, and suite entry points) as observed from public pages. It is not a forecast of future revenue, and it assumes no transfer of unrelated trademarks or third-party IP.

Replacement-cost baseline

We estimate what it would cost a competent small team to recreate this asset to a comparable level of craft, content depth, and conversion readiness.

Component	Replacement Cost Basis	Value Contribution
Cinematic brand + UI system	Design system, motion layer, reusable sections	$42,000
IA + navigation + portal directory	Multi-surface nav, network hub, site map surface	$18,000
Content library (84 posts)	Editorial production + on-site taxonomy + archives	$36,000
Product catalog + pricing surfaces	Service product pages, terms, deposit math	$24,000
Trust surfaces + policies	Status board, privacy/terms, credibility archive	$16,000
Suite entry points (SkyeDocx/Flow/Archive/Slides/Ops)	PWA-style tool landing surfaces + intros	$26,000
TOTAL (replacement-cost view)		$162,000

Fair Market Estimate

We adjust the replacement-cost baseline for what was not assessed (restricted areas) and for strategic value (ecosystem routing + monetization-ready pricing surfaces).

Adjustment	Rationale	Impact
Public-surface discount	Restricted areas (Vault/Admin/Dashboard) not assessed as full applications here.	-8%
Strategic premium	Portfolio hub connects 13+ portals; pricing surfaces show monetization readiness.	+12%
Net impact	Applied to replacement-cost baseline to reach fair market estimate.	≈ $168,400

Fair market asset value: $168,400 (indicative range $152,000 – $189,000).

This valuation is supported by the site's unusual combination of (1) deep editorial inventory, (2) explicit product pricing and deposit math, (3) multi-portal ecosystem routing, and (4) trust surfaces (status/policies/credibility) that buyers associate with “real operators,” not hobby sites.

Appendix: Scan Sources and Notes

- TrustLayer service: https://skyesol.netlify.app/services/trust-surfaces
- Skye DocX entry: https://skyesol.netlify.app/skyedocx/homepage

Limitations

This scan reflects public pages and observed responses at the time of access. It does not include authenticated portal areas (Vault/Admin/Dashboard), private analytics, server logs, or performance lab runs. If those private surfaces are production-grade applications, the total ecosystem valuation would be materially higher.
